LA VILLE MÉDIÉVALE
EN DÉBAT

Amélia Aguiar Andrade
Adelaide Millán da Costa, éditeurs
Ce livre traduit un dessein: celui d'encourager le débat sur la ville médiévale.
Il est le résultat d'un défi lancé à plusieurs auteurs, soit des historiens confirmés,
soit des jeunes chercheurs, pour écrire sur l'étude des agglomérations urbaines,
selon un plan défini. En effet, les textes sont organisés comme s'il s'agissait d'un
parcours, en tenant compte des variables qui influencent le développement d'un
projet de recherche: les sources et les méthodologies, les perspectives d'approche
et les grandes problématiques qui orientent l'analyse. En suivant ces paramètres,
le fil conducteur du livre est le partage des connaissances, des interprétations, des
interrogations, voire des doutes.
Plus qu'un recueil de textes refermé sur lui-même, cet ouvrage a l'ambition de
servir d'instrument de stimulation à de multiples débats.
Property study contributions towards the understanding of the medieval town: the parish of Santa Justa, Coimbra

Maria Amélia Álvaro de Campos
Universidade de Coimbra-CHSC

Abstract

This work offers some reflections on the relevance of the study of urban property, based on a discussion of its potentialities and disadvantages, in view of a more complete knowledge of the medieval town.

Based on an examination of the parish of Santa Justa in Coimbra (which is the subject of the author's doctoral thesis), this article puts forward the information available on the parish’s property, in order to demonstrate the importance of such aspects for the reconstruction of the urban landscape, recognising its evolution throughout the centuries and its urban and socio-economic transformation.

Furthermore, rare detailed descriptions from contemporary sources (predominantly documents of a contractual and economic nature) will make us aware of how an analysis of this kind is highly important for the study of an urban area which would undergo radical transformation — scarcely detailed in older cartography and practically unexplored by archaeology.

Keywords

Medieval towns, urban property, urban landscape, parish of Santa Justa (Coimbra).

1 Maria Amélia Álvaro de Campos holds a PhD degree in the History of the Middle Ages (University of Coimbra, 2008–2012), with a dissertation entitled Santa Justa of Coimbra in the Middle Ages: The Urban, Religious and Socioeconomic Space, under the supervision of Professor Maria Helena da Cruz Coelho. She is a researcher at the Centro de História da Sociedade e da Cultura, Universidade de Coimbra.
The same as with rural areas, urban areas in the medieval west were not far from being territories split up between various lords who divided the ownership of land and town buildings between themselves. With the exception of very few individual owners, who were able to retain state property of more or less significance within the urban area, to live in the town during the Middle Ages, meant essentially to enter into a relationship of dependence from a landlord, were he clergy or layman.

Indeed, with respect to ownership of land and state property, the town was divided — not without frequent opposition and dispute — between different owners who made those properties lucrative through indirect development, relying on the principle of emphyteusis. Thus, a majority of town inhabitants were merely the beneficiaries of the use of domain of the buildings and properties they resided in and where they would also carry out their professions, owing certain obligations to the owner, entered into in contracts, in addition to paying rent.

As far as descriptions of urban landed property are concerned, many studies on Portuguese towns have demonstrated how, from north to south, property comprised estates of many guises and functions. In fact, when speaking of urban property we must refer not only the house itself, endowed with both a residential and an economic significance, but also to the parcels of land with an agricultural capability — be they annexed to the residential units or standing independently from them — and to the equipment used for the treatment of food, storage and water supply, among others. In fact, the urban grounds were strewn with property comprising multiple buildings, infrastructures and mechanical devices, themselves

---

a reflection of the complex needs from a social fabric that was equally diverse regarding its own range of occupations and behaviours.

My doctoral project, examines the collegiate church of Santa Justa de Coimbra from the period of its foundation (towards the end of the eleventh century) until 1451. This collegiate and parish church are studied not only as a chapter with ecclesiastical responsibilities and liturgical and parish obligations, but also as the headquarters of a parish, considered in its condition as a territorial jurisdiction within the urban network of Coimbra and as a district with its own social identity, the profile of which this work goes on to outline. Supported by a basis of documents, composed mostly of records of an economic nature, produced in connection with the development of the institution's urban and rural landed property, this investigation also covers the study of property. This article will concern property located within the town alone.

Although at present quantitative data still cannot be supplied, the urban property of Santa Justa was mostly located within parish boundaries — hence the holdings of this property coincide with the existing description of the parochial jurisdiction. However, within the city of Coimbra, the parish of Santa Justa — absorbed by that of Santa Cruz before our day — stood outside the walls, on land which, during the medieval period, stretched along the river bank, at the northern city exit, which corresponds to one of the roads which followed the old Roman road connecting Olisippo (Lisbon) and Bracara Augusta (Braga). Its place of establishing, by the sandy margins of the River Mondego and far away from the almedina (citadel), bring it more closely to the rusticity of Coimbra's environs, than to the commercial and craftsmanship activity downtown — this is a fact that property classification clearly reflects.

---

7 The oldest reference to this church dates from 1098 (Portugaliae Monumenta Historica. A saeculo octavo post Christum usque ad Quintumdecimum, v. 1. Diplomatae et Chartae, Academia Scientiarum Oeconomicae, 1827, doc. 981 and Livro Preto. Cartulário da Sé de Coimbra, Coimbra, Arquivo da Universidade, 1999, doc. 427) and we know of the existence of an ecclesiastical college since 1175 (TT, Col. S. Justa, lv. 2, fls. 160v-163).

8 The year in which the last parish before the first half of the fifteenth century was extinguished.

At least until the end of the first half of the thirteenth century, we find buildings identified by the generic name of herdades or quintas, which we tend to associate with the rural countryside. However, from the end of that century, we cease to find references to this type of parcels of land on a broader scale, although other buildings were also marked by a strong rustic character. In fact, as part of the urban property of this institution, were also various types of houses, which could be térreas (single-storey houses), sobradadas (houses having two floors) and sobradadas com sótão (of two stories and a cellar), but also small plots of land suitable for agriculture, normally surrounded by walls, such as courtyards and the enclosures annexed to houses or independent from them, and where occasionally there were fruit trees, one or more olive trees and even a grapevine. Furthermore, these lands would still be farmed for grapes and olives during the fifteenth century. Within the more or less continuous precinct made up of rows of houses and the parcels of land of rural characteristics just described, this church also owned wine presses, ovens, furnaces and wells.

The thesis also seeks to describe this property and evaluate its disposition along the area, through the analysis of written documents of an economic nature, such as tenancy contracts and the barter of property. In the same way, the registers of properties bequeathed to the church, which was responsible for the constitution of most of its ownership, are important, as well as are the (rare) contracts of purchase and sale. Finally, juridical procedures, above all those regarding the good keeping of emphyteusis contracts or the cases of destruction or usurpation of this church's

23 These emphyteusis contracts of transfer of usufruct of the property can take on three forms: emprazamentos (temporary concessions for life spans, normally for the span of two or three lives), aforamentos (perpetual and hereditary concession contracts) and arrendamentos (lease contracts for only a few years). In this study, the first are clearly in the majority.
landed property also provide us with relevant information. Since we do not possess any cadastral registers nor inventories for the Santa Justa properties for this period, this investigation shall aim at bringing to the surface sundry documentation as much as possible.\textsuperscript{24}

Recent works on the landscape of the medieval town have demonstrated the frailty of an analysis based exclusively on the sources of the time by underlining the necessity to link this information with more recent documentation and literature, with pictorial evidence and cartography from various periods and with archaeological results.\textsuperscript{25} Unfortunately, the oldest literary accounts\textsuperscript{26} and the cartography of Coimbra\textsuperscript{27} contain little detail about this area of the town, while the excavations carried out in there have proved fruitless — both for natural reasons, due to the high phreatic level, and for human ones, since during the preceding century this region suffered radical interventions and transformations which eliminated the last remaining vestiges of the ancient structures, which now makes it impossible to carry out more extensive excavations.

In this context, the study of this collegiate church’s property — based on a discerning and methodical investigation of the characteristics and the very history of the landed property itself — can make a significant contribution not only to sketching out this now irreversibly destroyed landscape, but also towards the perception of how this urban area was organised and occupied. Some of the information supplied by this analysis will now be reviewed.

With regard to buildings, we are able to understand how the row of houses, arranged contiguously in Braun’s representation,\textsuperscript{28} materialised with walls made of stone, wood and lime,\textsuperscript{30} with slits for doors in the façade\textsuperscript{31} and covered with roof tiles.\textsuperscript{32} However, this documentation is not so helpful in tracing a more detailed

description. For example, houses are identified therein according to the number of floors and only rarely is mention made of their size, the number of rooms, or even the materials used for their construction. As to the size of buildings, the information provided by these contracts fails to go beyond a subjective 'large' or 'small'. Documents of a contractual nature such as these will only provide us with indications that remain at a general and subjective level also as far as the location of properties is concerned (such as the identification of streets and the description of buildings, relying on indicative elements found in the surrounding area), or yet the names of landlords or agents in neighbouring buildings. These references will only allow today's historian to come at more precise locations when carefully set against a number of cross references. Nevertheless, it is often through these references to property boundaries that we are able to know where communal structures — such as sanitary equipment and residual waterways — would have stood.

A more encompassing analysis makes it possible to discern human occupation levels and demographic dynamics from contracts of purchase and tenancy of landed property in a given district over a wide time span. A climate of expansion is reflected in the laying down of new streets and in the breaking down of barriers and closes standing in the way of the main roads, along with modifications made to the inside of the buildings themselves and the gradual addition of new stories, all of which can be identified from the documentation. On the other hand, the existence of pardieiros (hovels) and demolished houses, which the documentation acknowledges, gives us an idea of the state of dereliction of lodgings as a consequence of demographic contraction. In the parish of Santa Justa, this is very prominent throughout the second half of the thirteenth century into the first of the fourteenth, at the end of which period the opposite becomes apparent — as indeed is the case also with the majority of urban nuclei in the country. Furthermore, the population density in a specific region is also reflected in the frequency of emphyteusis contracts, as well as in the characteristics and conditions which they contain. However, this kind of analysis falls beyond the objectives of this essay.

33 See for instance, ANTT, Col. S. Justa, m. 33, n. 746 (1409.11.17).
34 See ANTT, Col. S. Justa, m. 11, n. 211 (1362.02.13).
35 See for instance, ANTT, Col. S. Justa, m. 27, n. 622 (1369.03.23).
36 Detailed knowledge of this subject is only possible through the study of other sources, like those used by D. MENJOT, Murcia: ciudad fronteriza en la Castilla Bajomedieval, Madrid, Casa de Velázquez, 2002, p. 380-386.
37 In the region of Coimbra, population rose in the twelfth and the thirteenth centuries, only to fall steeply after 1340: see M. COELHO, O Baixo Mondego nos Finais da Idade Média, Lisboa, Imprensa Nacional – Casa da Moeda, 1989, p. 12-23 and 26-38. In our parish in the suburb of Coimbra, for example on the street where the Collegiate of Santa Justa owned a large number of buildings since the twelfth century, three-story houses existed in 1359 (ANTT, Col. S. Justa, m. 26, n. 542) whereas pardieiros became widely spread between 1387 and 1401 (ANTT, Col. S. Justa, m. 32, n. 715 and m. 26, n. 561).
The observation of property location has enabled us to further understand, in broad terms, the social texture of the parish, through the identification of the tenants of the neighbouring buildings and the use of toponymy; both reveal the place of residence of certain artisans and other professionals, and from the fourteenth century also the Jewish and the prostitution quarters — two examples of well-defined areas which the town's population, through enacting royal and municipal regulations, pushed the urban centre outside, for moral and religious reasons.

Deeper research on the urban landed property of an institution of this kind allows us to catch a glimpse of the outline of both the natural and built up landscape of the urban parish, making out the rows of houses, but also emphasising the complemental presence of horticultural land and of distinct equipment for the production of edible goods, as well as for the conveyance and supply of water. In dealing with a wide chronological span such as this, in all likelihood it would be possible to illustrate the whole process of development and to detect varying degrees for the region's urban transformation. Based on the assumption that the church with its forecourt functioned as a dominant complex within the urban structure of the parish, governing the layout of the main streets around it, the analysis of urban landed property strikes us as fundamental to any attempt at defining the medieval road network, the outline of urban areas and their population distribution — even when such places have withstood such profound transformations over the ages, as is the case of Santa Justa de Coimbra.

38 Among others identified in this parish, there is the Rua dos Oleiros (Potters' Street) (ANTT, Cab. Sé, 1ª inc., m. 10, n. 19; 1217.12) and Rua dos Caldeireiros (Boilermakers' Street) (ANTT, Cab. Sé, 1ª inc., m. 13, n. 25; 1242.10). The establishment of these professions in the suburbs resulted not only from the close proximity with raw materials and the riverbed, but also from the distance which needed keeping from the centre of town, because of noise and pollution. See I. GONÇALVES, «Posturas Municipais e vida urbana na Baixa Idade Média: o exemplo de Lisboa», in Um Olhar sobre a cidade Medieval, Cascais, Património Histórico, 1996.

39 See ANTT, m. 27, n. 621 (1384.10.27). This is the second establishment of a Jewish quarter in Coimbra, which until then had been by the outer wall, near the streets with greater economic activity. See S. GOMES, A Comunidade Judaica de Coimbra Medieval, Coimbra, INATEL, 2003 and L. TRINDADE, «Jewish Communities in Portuguese Late Medieval Cities: Space and Identity», in J. CARVALHO (ed.), Religion, Ritual and Mythology: Aspects of Identity Formation in Europe, Pisa, University Press, 2006.
